- Large key distance
- Progressive keyboard repeating rate

Functionality

Download
Manual
Adobe PDF

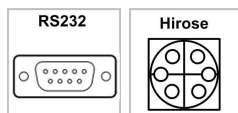

Definition

The Keypad operates exclusively over the COM 2 connection of the vicosys®. The standard interface COM 1 is reserved for the RS232 communication.

With pictor® M16xx/M18xx the connection is made over trigger input. With serial pictor® types the connection is also possible over the Standard-RS232-cable.

Progressive keyboard repeating rate means continued pressing of the same key the action in rising speed repeats.
